

## **Disaster Recovery Planning & Business Continuity Services.**

### **Introduction.**

Most businesses are now completely dependent on their electronic data. Fire or theft, flood damage, natural disasters and hacking can destroy vital information which can end up costing you money, customers and ultimately your entire business.

95% of businesses which suffer a disaster will cease trading within 18 months. The other 5% that survived did so because they planned ahead and invested in a Disaster Recovery procedure.

A Disaster Recovery solution will safeguard your data and get you back up and running within hours of the unexpected happening. Don't be one of the many businesses that take their data for granted and end up with nothing.

# Safeguard your business with a Disaster Recovery Solution.

## Overview.

Our Disaster Recovery package is designed to allow your staff to work from anywhere with an internet connection once the recovery procedure is implemented. Because we replicate your network on a virtual machine, all employees will have full access to their work and email within hours of a disaster occurring. Our Disaster recovery procedure is also the quickest way to setup a temporary office at short notice.

## Giving customers peace of mind.

Assure your customers that business will continue unhindered in the event of a disaster. Implementing a Disaster Recovery solution will also give your customers assurance that confidential data is being stored correctly.

## Our Disaster Recovery Process.

**Inventory audit** - A Project Manager will undertake a full audit of your network infrastructure and discusses your requirements. We will then recommend a unique Disaster Recovery procedure that is suitable for your requirements.

**Co-location server replication** - We take detailed images of every server within in your organisation. These images are installed onto our in-house "virtual server" and very server is replicated. In the event of a disaster occurring, our system will take over from your onsite hardware and within hours you will be able to resume work from any location that has an internet connection.

**Offsite backup online** - All critical data is backed up daily to our 100% secure offsite facilities ensuring that no business critical information is ever lost.

**Email retention** - A backup of company email is retained on a daily basis, enabling the rapid resumption of company email in the event of a disaster.

**Regular testing** - We undertake Disaster Recovery "trial runs" to ensure we can replicate your network quickly and efficiently when required. Disaster recovery is second nature to our specialists and we know how important it is to have a quick turnaround when disaster strikes.
