

E-pulse. Keeping a Watchful Eye Over Your IT Network.

Introduction.

E-pulse is a revolutionary new "real-time network monitoring" system which has been designed to monitor all key aspects of your IT network, from simple scheduled tasks to areas that have the potential to cause major disruption within the workplace.

E-pulse allows us to fix any network related problems before you even know they exist. E-pulse lets us monitor all aspects of your Windows and Linux servers, plus workstations and other devices such as routers, switches and more. When a failure is detected, The E-pulse network monitor will alert our team of engineers by email, pager or SMS, as well as automatically taking the preconfigured corrective action by, for example, rebooting the machine, restarting the service or even running a script.

There are many network monitoring systems on the market, but few can match the efficiency and accuracy that E-pulse can deliver.
